KW sCD4-SCFv(17b) is a neutralising bispecific fusion protein capable of binding to two sites of its target protein. The protein comprises a first binding domain capable of binding to an inducing site on the target protein, a second binding domain capable of forming neutralising complex with an induced epitope of the target protein and a linker connecting the binding domains. sCD4-SCFv(17b) comprises a soluble CD4 fragment (containing domains D1 and D2) fused to a single chain Fv portion of antibody 17b via a linker. sCD4-SCFv(17b), its variant, analogue or mimetic is used for inactivating gp120 protein of HIV, and for

It is also used for blocking and preventing the binding of the viral or recombinant gp120 protein to soluble CD4 or lymphocyte CD4 and for inhibiting HIV replication. The chimeric proteins is therefore useful for treating HIV infection and also AIDS. It is are particularly useful in the prevention of infection during or immediately after HIV exposure (e.g., mother/infant transmission, post-exposure prophylaxis, and as a topical inhibitor) and for providing long term resistance to HIV infections and AIDS. Gene therapy is used to secrete the bispecific protein at mucosal surfaces, such as the vaginal, rectal or oral mucosa. The fusion proteins is highly potent, broadly cross-creactive with neutralising antibody with high in vivo activity and no Fc mediated undesirable targetting properties. When the fusion protein is substantially derived from human proteins, it has minimal immunogenicity and toxicity in humans which is of great value in prevention of infection of during or immediately after HIV exposure

This can give rise to plasma membrane binding, enhanced purifiability, micelle formation etc. especially useful in the production of chimeric targeted drugs, to produce micellular or liposomal delivery systems or in enhanced purification and screening of cells, proteins or DNA libraries. This can give rise to plasma membrane binding, enhanced purifiability, micelle formation etc. especially useful in the production of chimeric targeted drugs, to produce micellular or liposomal delivery systems or in enhanced purification and screening of cells, proteins or DNA libraries. The soluble human T4 protein blocks the binding of HIV to T4+ cells and is therefore useful for the treatment of AIDS. Monoclonal antibodies against the T4 protein may be used as vaccines for immunising subjects against AIDS

Human immunodeficiency virus (HIV) uses ST4 as a target receptor on T cells. The invention relates to glycosylated sT4 which functions by blocking the binding of HIV to T4 target cells, and can be used for the prophylaxis and treatment of AIDS patients. Administration of sT4 effectively inhibits the cell to cell spreading of HIV infection and also the fusion of HIV-infected T4 cells and non-infected T4 cells. The administration of T4 alleviates several symptoms associated with AIDS, and prevents the occurrence of new pathological changes. The sT4 glycoprotein is useful as a reagent to identify natural, synthetic or recombinant molecules which act as the appentic agents or inhibitors of T4+ cell interactions and in

To obtain the fusion protein, DNA encoding CD4 was linked to IgM DNA at the Mst2 site upstream of the CH1 region (see AAA50662). Fusion protein CD4Mmu and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgM fusion proteins such as CD4Mmu provide complement-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-JAN-1988;

                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Mg which is constructed from CD4 linked to human IgM upstream of the CH1 region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion protein; human; CD4; IgM; immunoglobulin; gp120; anti-human immunodeficiency virus; CD4Mg.

                                                                                                                                                                                                                                                                                                                          This sequence represents the amino acid sequence of glycosylated sT4 glycoprotein. Human immunodeficiency virus (HIV) uses sT4 as a target receptor on T cells. The invention relates to glycosylated sT4 which functions by blocking the binding of HIV to T4 target cells, and can be used for the prophylaxis and treatment of AIDS patients. Administration of sT4 effectively inhibits the cell to cell spreading of HIV infection and also the fusion of HIV-infected T4 cells and non-infected T4 cells. The administration of T4 alleviates several symptoms associated with AIDS, and prevents the occurrence of new pathological changes. The sT4 glycoprotein is useful as a reagent to identify natural, synthetic or recombinant molecules which act as therapeutic agents or inhibitors of T4+ cell interactions and in diagnostic assays for detection T4 proteins

The present sequence is human CD4. Human CD4 extracellular domains 1 and C2 were used in the construction of CD4 oligomerisation fusion proteins. The fusion proteins contain an oligomerisation domain that enables the proteins to bind to one another to form oligomers. The oligomers may be used in an invention relating to a method for screening for compounds with the ability to inhibit a low affinity receptor-ligand interaction. The method uses an interfacial optical assay, such as surface plasmon resonance (SPR). The method is useful for screening candidate compounds for the ability to inhibit interaction between MHC/peptide complex and TC cell receptor, and MHC/peptide complex and CDB or CD4 co-receptor. The compounds identified by the above methods which interfere with T cell receptor binding to a particular HLA type molecule are useful as immune inhibitors for treating carcinomas, autolammune diseases such as multiple sclerosis, human immunodeficiency virus (HIV) infection, rheumatoid carthritis, Hashimoto's disease, insulin dependent diabetes, Good pasture's syndrome, uveitis, psoriasis and graft rejection

This antigenic fragment binds to DC-SIGN or is exposed upon gp120 binding of DC-SIGN due to concomitant conformational change. DC-SIGN is a receptor that is specifically expressed on dendritic cells and facilitates infection of T lymphocytes with HIV. DC-SIGN is identical to a HIV-1 gp120-binding C-type lectin. It is specifically expressed constitutively on T lymphocytes with high affinity. The antibody of the invention inhibits the transenhancement of HIV entry into a T cell or macrophage facilitated by dendritic cells. The antibody is useful to treat or prevent HIV infection. The present sequence represents a human CD4 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         An antibody for the treatment or prevention of HIV-infection comprises gp120 portion which binds to DC-SIGN or is exposed upon gp120 binding c DC-SIGN due to concomitant conformational change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 458 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 115-116; 131pp; English

The invention relates to a binding domain-immunoglobulin fusion protein CC comprising a binding domain polypeptide, an immunoglobulin heavy chain CC immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain CC constant region polypeptide that is fused to the hinge region CC polypeptide, and an immunoglobulin heavy chain CH3 constant region CC polypeptide, and an immunoglobulin heavy chain CH3 constant region CC polypeptide, and an immunoglobulin heavy chain CH3 constant region CC polypeptide, a mutated human IgG1 immunoglobulin hinge region polypeptide, a mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the first cysteine is not mutated; a contains 2 cysteine residues, where the first cysteine is not mutated; a contains 2 cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from CC (a) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no more than one cysteine residues; and a mutated human IgG1 immunoglobulin hinge region cysteine residues; where the mutated human IgG1 concretains no more than one cysteine residues; where the mutated human IgG1 immunoglobulin hinge region cysteine residues. The binding domain-immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein is capable of at least one immunological activity comprising antibody companies of at least one immunological activity comprising antibody companies of the mutated cytotoxicity (ADCC) and complement fixation. The binding domain-immunoglobulin fusion protein is companies of specifically binding to an construct comprising the polymcleotide (operably linked to a promoter), construct comprising the polymcleotide (operably linked to a promoter), construct comprising the polymcleotide with a recombinant expression construct comprising the polymcleotide with a recombinant expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              17-JAN-2001; 2001US-0367358P

The present sequence is a binding doma: immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification and is also available in electronic format directly from USPTO at sequence. html?DocID=20030118592. The authors have not identified the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC claimed are a vector, a method for identifying a nucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence CC which is differentially regulated in an animal subjected to pain and a CC kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence CC that is differentially expressed in neuronal tissue of a first animal CC subjected to pain, a method for identifying an agent CC the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates CC the expression of a polynucleotide sequence which is differentially CC expressed in an animal subjected to pain, a method for identifying a compound which regulates the cc compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating compain and a pharmaceutical composition comprising the one or more complypeptides or their antibodies. The polynucleotide or the compound that cc polynucleotide or their antibodies. The polynucleotide or the compound that composition comprising a medicament for treating pain (e.g. spinal segmental nerve injury (CNINg), chronic constriction conjury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene CC the specification) which is differentially expressed during pain. Note: CT has because data for this patent did not form part of the printed composition introduced at the printed in electronic form directly from WIPO at the confidence of the printed of the printed of the printed composition introduced in electronic form directly from WIPO at the specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in ar renotransplant rejection or mechanical oreplacement rejection, in ar individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lungs, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
              HIV-1 infection; human immunodeficiency virus-1; CD4+ cell; chimeric endoplasmic reticulum; ER retention; envelope protein gp160; T cell receptor CD9epsilon chain; C-terminal domain; CD4epsilon15; gene therapy; human; receptor.

                                                                                                                                                                                 밁
                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                  The invention relates to a composition for the treatment or prevention of CC comprises CD4+ cells that have been transduced with a vector that encodes CC a chimeric CD4 molecule which is capable of being retained in the CC endoplasmic reticulum (ER). The invention also encompasses the use of a Soluble protein factor produced by CD4+ cells that have been transduced CC with a vector encoding a chimeric CD4 protein; and the use of an CC expression system encoding a chimeric CD4 protein. The ER-localised CC chimeric CD4 molecule binds to the HIV-1 envelope protein gpi50, CC resulting in HIV-1 retention in the ER and thereby preventing viral CC comprises CD4 fused to 15 amino acids of the C-terminal domain of the TC cell receptor CD3epsilon chain; this chimeric CD4 molecule is designated CC CD4epsilon15 (ADA44807). A known chimeric CD4 of similar structure but CC containing only 10 amino acids from CD3epsilon can also be used. CC compositions of the invention have an in trans effect on the replication of HIV-1, and may be used to treat and prevent HIV-1 infection. The CC is specifically claimed for use in compositions of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (Ig) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections. The present sequence represents the fusion protein in CD4Mmu where the CD4 is linked to human IgG1 at the Mst2 site upstream of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion gene encoding immunoglobulin-CD4 fusion proteins, useful in the treatment of HIV or simian immunodeficiency virus infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CA1340741-C

                                                                                                                                                                                                                                                                       US-10-092-138A-25
Sequence 25, Application US/10092138A

Patent No. 6743630

GENERAL INFORMATION:
APPLICANT: Sato, Taka-Aki
TITLE OF INVENTION: METHOD OF PREPARING A PROTEIN ARRAY BASED ON
TITLE OF INVENTION: BIOCHEMICAL PROTEIN-PROTEIN INTERACTION
FILE REFERENCE: 65823/JPM/PT
CURRENT APPLICATION NUMBER: US/10/092,138A
CURRENT FILLING DATE: 2002-03-06

NUMBER OF SEQ ID NOS: 34
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CURRENT APPLICATION NUMBER: US/09/517,605
